Identifying a candidate agent as modulator of function of a target protein for treating cellular proliferation disorders by adding a candidate agent to a mixture of the target protein that directly/indirectly produces ADP or phosphate.

Claim 1, SEQ ID NO 6; 26pp; English.

systems used to identify compounds for the treatment of cellular proliferation disorders. Specifically, it refers to candidate agents that are capable of modulating the activity of target proteins having motor domains, such that the target protein directly or indirectly produces ADP to phosphate. Furthermore, this activity can be determined using fluorescence or absorbance readouts. The present invention describes a method that identifies modulators of the target protein, which is a This invention relates to a novel method for high throughput screening

kinesin-like DNÀ binding protein (known as KID) as cytostatic, cardian immunomodulators and antiinflammatories. Accordingly, through gene therapy, they can be used for the treatment of cancer, hyperplasias, restenosis, cardiac hypertrophy, immune disorders and inflammation. The polypeptide sequence is human KID protein (SeqID 6) of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     QREGKLYLIDILAGSEDNRRTGNKGLRLKESGAINTSLFVLGKVVDALNQGLPRVPYRDSK

The invention relates to human microtubule motor proteins and the nucleic acids encoding them. The invention also relates to a method of screening for for modulators of a mnotor protein which has microtubule stimulated ArPase activity, a method of testing for ArPase activity of microtubule motor proteins, methods to identify candidate agents that bind to a target protein, not act as a modulator of the binding characteristics or biological activity of a target protein, modulators of the target protein, and methods of treating callular proliferation disorders such as and inflammation, for treating disorders associated with kinesin-like DNA binding protein (KID) and for inhibiting KID. The sequences are used for screening for modulators of motor proteins useful for treating cellular screening for modulators of motor proteins useful for treating cellular proliferation disorders such as cancer, hyperplasias, restenosis, cardiac hypertrophy, immune disorders and inflammation, for treating autoimmune disorders and inflammation, for treating autoimmune cassociated with KID and for inhibiting KID and for treating autoimmune proliferation induced after medical procedures including surgery and proliferation induced after medical procedures including surgery and angioplasty. This sequence represents a human microtubule motor protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          TLKYQFDAFYGERSTQQDIYAGSVQPILRHLLEGQNASVLAYGPTGAGKTHTMLGSPEQP 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ठ
                                                                                                                                                                                                                                                                        This invention relates to a novel method for high throughput screening systems used to identify compounds for the treatment of cellular proliferation disorders. Specifically, it refers to candidate agents that are capable of modulating the activity of target proteins having motor domains, such that the target protein directly or indirectly produces ADP or phosphate. Furthermore, this activity can be determined using fluorescence or absorbance readouts. The present invention describes a method that identifies modulators of the target protein, which is a kinesin-like DNA binding protein (known as KID) as cytostatic, cardiants, immunomodulators and antiinflammatories. Accordingly, through gene therapy, they can be used for the treatment of cancer, hyperplasias, restenosis, cardiac hypertrophy, immune disorders and inflammation. This polypeptide sequence is human KID protein (SeqID 8) of the invention.

The invention relates to human microtubule motor proteins and the nucleic acids encoding them. The invention also relates to a method of screening for modulators of a motor protein which has microtubule stimulated ATPases activity, a method of testing for ATPases activity of microtubule motor proteins, methods to identify candidate agents that bind to a target protein, or act as a modulator of the binding characteristics or biological activity of a target protein, and methods of treating cellular proliferation disorders such as cancer, hyperplasias, restencesis, cardiac hypertrophy, immune disorders and inflammation, for treating disorders associated with Kinesin-like DNA binding protein (KID) and for inhibiting KID. The sequences are used for screening for modulators of motor proteins useful for treating cellular proliferation disorders such as cancer, hyperplasias, restencists, cardiac hypertrophy, immune disorders and inflammation, for treating autoimmune disorders and inflammation, for treating autoimmune disorders and inflammation, for treating autoimmune diseases, arthritis, graft rejection, inflammatory bowel disease and proliferation induced after medical procedures including surgery and and of the plants of the disease and problem and protein microtubule motor protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
Human; microtubule motor protein; cellular proliferation disorder; cancer; hyperplasia; restenosis; cardiac hypertrophy; immune disorder; inflammation; kinesin-like DNA binding protein; KID; autoimmune disease; arthritis; graft rejection; inflammatory bowel disease; angioplasty.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New isolated microtubule motor protein, useful for screening modulators for treating cellular proliferation disorders such as cancer, hyperplaaias, restenosis, cardiac hypertrophy, immune disorders and inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            61 TLKYQFDAFYGERSTQQDIYAGSVQPILRHLLEGQNASVLAYGPTGAGKTHTMLGSPEQP

Specifically, it refers to candidate agents that are capable of modulating the activity of target proteins having motor domains, such that the target protein directly or indirectly produces ADP or phosphate. Furthermore, this activity can be determined using fluorescence or absorbance readouts. The present invention describes a method that identifies modulators of the target protein, which is a kinesin-like DNA binding protein (known as KID) as cytostatic, cardiants, immunomodulators and antiinflammatories. Accordingly, through gene therapy, they can be used for the treatment of cancer, hyperplasias, restenosis, cardiac hypertrophy, immune disorders and inflammation. This polypeptide sequence is human KID protein (SeqID 2) of the invention.

```
cc activity, a method of testing for ATPase activity of microtubule motor proteins, methods to identify candidate agents that bind to a target.

Cr protein or act as a modulator of the binding characteristics or biological activity of a target protein, modulators of the target protein, and methods of treating callular proliferation disorders such as cancer, hyperplasias, restenosis, cardiac hypertrophy, immune disorders and inflammation, for treating disorders associated with Kinesin-like DNA binding protein (KID) and for inhibiting KID. The sequences are used for screening for modulators of motor proteins useful for treating cellular proliferation disorders such as cancer, hyperplasias, restenosis, cardiac hypertrophy, immune disorders and inflammation, for treating disorders associated with KID and for inhibiting KID and for treating autoimmune confiseases, arthritis, graft rejection, inflammatory bowel disease and proliferation induced after medical procedures including surgery and angioplasty. This sequence represents a human microtubule motor protein of the invention. Note: The specification states that this sequence is encoded by the nucleic acid featured as SEQ ID NO:1, but this does not

The invention elates to novel isolated, enriched or purified nucleic acid molecules encoding a kinase polypeptide. The nucleic acid molecule comprises a sequence that: (a) encodes a kinase polypeptide; (b) is a complement of (a); (c) hybridizes under stringent conditions to (a) and conditions to (a) and conditions to (b) perpetide in (a) except that it lacks one or more, but not all, of an CC terminal domain, a coiled-coil structure region, a spacer region and a CC terminal domain, a coiled-coil structure region, a spacer region and a CC terminal tail; or (e) is a complement of (d). The nucleic acid molecules, polypeptides, methods and substance are useful for treating cancers, immune-related diseases or disorders, cardiovascular disease, brain or curvantal acid seases, and metabolic disorders. The disorders are preferably cancers of the tissues or of hematopoietic origin, diseases of the central or peripheral nervous system, Alzheimer's disease, cor viral infections caused by fungi, ocular diseases, miltiple sclerosis, amyotrophic lateral sclerosis, viral infections caused by fungi, ocular diseases, migraines, pain, conteria, infections caused by fungi, ocular diseases, migraines, pain, conteria, infections caused by fungi, ocular diseases, migraines, pain, contesting disorders, dyskinesias, metabolic disorders and organ transplant content on invention. This sequence corresponds to one of the kinase polypeptides of the invention and corresponds to one of the kinase polypeptides of
                                                                                                                                                                                                                                                                                                                                             New isolated, enriched or purified nucleic acid molecule encoding a kinase polypeptide, useful for treating cancer, immune-related diseases, cardiovascular disease, brain or neuronal-associated diseases and

Specifically, it refers to candidate agents that are capable of modulating the activity of target proteins having motor domains, such that the target protein directly or indirectly produces ADP or phosphate. Furthermore, this activity can be determined using fluorescence or absorbance readouts. The present invention describes a method that identifies modulators of the target protein, which is a kinesin-like DNA binding protein (known as KID) as cytostatic, cardiants, immunomodulators and antinfinammatories. Accordingly, through gene therapy, they can be used for the treatment of cancer, hyperplasis, restenosis, cardiac hypertrophy, immune disorders and inflammation. This polypeptide sequence is human KID protein (SeqID 4) of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                         human; enzyme; motor domain; kinesin-like DNA binding protein; KID; cytostatic; cardiant; immunomodulator; antiinflammatory; gene therapy; cancer; hyperplasia; restenosis; cellular proliferation disorder; cardiac hypertrophy; immune disorder; inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Identifying a candidate agent as modulator of function of a targ protein for treating cellular proliferation disorders by adding candidate agent to a mixture of the target protein that directly/indirectly produces ADP or phosphate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           99.7%; Score 1763; DB 7; Length 512; 100.0%; Pred. ```
The invention relates to human microtubule motor proteins and the nucleic acids encoding them. The invention also relates to a method of screening for modulators of a motor protein which has microtubule stimulated ArPase activity, a method of testing for ArPase activity of microtubule motor proteins, methods to identify candidate agents that bind to a target protein or act as a modulator of the binding characteristics or protein act activity of a target protein, modulators of the target protein, modulators of the target protein, and methods of treating cellular proliferation disorders such as cancer, hyperplasias, restenosis, cardiac hypertrophy, immune disorders and inflammation, for treating disorders associated with kinesin-like DNA binding protein (KID) and for inhibiting KID. The sequences are used for screening for modulators of motor proteins useful for treating cellular proliferation disorders such as cancer, hyperplasias, restenosis, cardiac proteins useful for treating disorders and inflammation, for treating disorders

associated with KID and for inhibiting KID and for treating autoimmune diseases, arthritis, graft rejection, inflammatory bowel disease and proliferation induced after medical procedures including surgery and angioplasty. This sequence represents a human microtubule motor protein of the invention. Note: The specification states that this sequence is encoded by the nucleic acid featured as SEQ ID NO:3, but this does not appear to be the case.

Clouaire Roussigne M, Girard J, Amalric F, WPI; 2004-525034/50.

The present invention describes a method for modulating the expression of a thanaros (death)-associated protein (THAP) responsive gene. The method comprises modulating the interaction of a THAP-responsive gene. The method the expression of the THAP responsive gene. Also described: (1) a method of modulating the the THAP responsive gene. Also described: (1) a method of modulating the bytession of a gene responsive to a THAP/chemokine of modulating the separaceutical composition comprising a THAP responsive element; (4) a cell comprising a transcription factor decoy described above; (5) methods of modulating the interaction between a nucleic acid and a THAP-responsive element; (1) a cell comprising a transcription factor decoy described above; (5) methods of a vector packaging cell line complex; (5) a vector packaging cell line complex; (5) a vector packaging cell line complex; (5) a vector packaging cell line complex; (5) a vector packaging cell line complex; (5) a vector packaging cell line complex; (5) a vector packaging cell which expresses a recombinant THAP-rainly polypeptide of its biological fragment; (7) a method of constructing a cell which expresses a recombinant THAP-rainly polypeptide; (8) a method of mellotating cell which expresses a recombinant THAP-rainly polypeptide; (8) a method of constructing a cell comprising a viral vector which compliates the transproper of a themokine into the nucleus; (10) methods of a cancerous tissue, excessive of insufficient apoptoms; (10) methods for reducing the symptoms associated with a condition metatasis of a cancerous tissue, excessive or insufficient apoptoms; cardiovascular disease and neurodegenerative granding and a THAP-family polypeptide in an individual; (11) a vector of strainfient apoptoms; cardiovascular disease and neurodegenerative comprising a THAP-family polypeptide in an individual; (11) a vector comprising the vector described above or that expresses a THAP-family polypeptide that dees not bind to a chemokine or a THAP-family polypeptide or its Modulating expression of a Thanatos (death)-Associated Protein (THAP) responsive gene for preventing or treating e.g. cancer or inflammation, comprises modulating the interaction of a THAP polypeptide with a nucleic for reducing symptoms of conditions such as excessive or insufficient angiogenesis, inflammation, metastasis of a cancerous tissue, excessive or insufficient apoptosis, cardiovosacular disease or neurodegenerative diseases. The present sequence is used in the exemplification of the Example 47; SEQ ID NO 425; 612pp; English.

The prostate cancer antigens can have neuroprotective, cytostatic, cardioactive, immunomodulatory, muscular, vulnerary, gastrointestinal, nephrotropic, antiinfective, grnaecological and antibacterial activities, and can be used in gene therapy. The prostate cancer antigen polynucleotides may be used for detection of prostate cancer, chromosome identification, as chromosome markers, and for numerous other diagnostic or research purposes. The prostate cancer antigens may be used to treat disorders such as neural, immune, muscular, reproductive adisorders gastrointestinal, pulmonary, cardiovascular, renal, and proliferative disorders, wounds, and infectious diseases. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins (ABBS-137-ABB-1072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell interactions.

detecting the polynucleotide. The polynucleotides ADM01316-ADM03758 are useful in gene therapy, for developing a diagnostic marker or medicines for regularing their expression and activity, or as a target of gene therapy. The proteins ADM03759-ADM06201 encoded by the polynucleotides are useful as pharmaceutical agents. The present sequence represents a protein sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                               structural and cytoskeleton-associated polypeptide, SCAP, cell proliferative disorder; cancer, atherosclerosis, viral infection, HIV, neurological disorder; Parkinson's disease, Alzheimer's disease;

```

The present sequence represents a structural and cytoskeleton-associated polypeptide (SCAP). The SCAP polypeptides and polynucleotides of the invention are useful for diagnosing, preventing or treating diseases or conditions associated with aberrant expression of SCAP, such as cell proliferative disorders (e.g. cancer or atherosclerosis), viral infections (e.g. HIV) or neurological disorders (e.g. Parkinson's disease, Allahaimer's disease or stroke). These may also be used for assessing the effects of exogenous compounds on the expression of nucleic acid and amino acid sequences of SCAP. The SCAP or its fragments are also useful in screening compounds for effectiveness as agonist or antagonist of the polypeptides, or in altering the expression of the target polymucleotide and compounds that specifically bind to or modulate the activity of the polypeptide. 70 YGERSTQQDIYAGSVQPILRHLLEGQNASVLAYGPTGAGKTHTMLGSPEQPGVIPRALMD 129 Swarnakar A, Ho A, Hafalia AJA, Emerling BM, Ison CH, Nguyen DB; Chien D, Lu DAM, Yang YG, Yue H, Murage J, Griffin JA, Burrill JD; Wang JT, Marquis JP, Blake JJ, Chawla NK, Lee S, Becha SD, Lee SY; Richardson TW, Bhatia UG, Zheng W, Sprague WW, Tang YT, Azimzai Y; 19 RVRVAVRLRPF--VDGTAGAS-----DPPCVRGMDSCSLEIANWRNHQETLK-YQFDAF Gaps New human structural and cytoskeleton-associated proteins and polynuclectides for diagnosing, preventing or treating diseases associated with aberrant protein expression, e.g. cancer, 16; 31.6%; Score 559; DB 8; Length 998; 38.9%; Pred. The invention describes an isolated novel human microtubule motor protein (I) is useful for screening modulators of HsKip3d. The method comprises contacting (I) with a candidate agent in a test and control concentration, and assaying for the level of HsKip3d activity, where the HsKip3d activity between the test and control concentration indicates a modulator. A composition containing (I) is useful in the treatment of inflammation, cardiac hypertrophy, cellular proliferation diseases e.g. inflammation, cardiac hypertrophy, cellular proliferation diseases e.g. hyperplasias, reseneousls, cancer, including solid tumours of skin, breast, brain, lung, heart, bone, genitourinary tract, liver, nervous system, adrenal glands, haematologic, gynaecological and testicular carcinomas, autofimmune disease, arthritis, graft rejection, inflammatory bowel disease, proliferation induced after medical procedures, such as surgery, angioplasty. The motor domains may also be used in nanotechnological applications, and polymuclectides encoding the proteins is further useful for inclusion on GeneChip (RTM) array or for use in expression monitoring. This is the amino acid sequence of the novel human motor inclusion contents of the motor domain, the method of the

Patent No. 638841

GENERAL INFORMATION:

APPLICANT: Beraud, Christophe

APPLICANT: Breadnan, Richard

TITLE OF INVENTION: No. 6368841e1 motor proteins and methods for TITLE OF INVENTION: their use

FILE REFERENCE: 1045

CURRENT FILING DATE: 2000-11-27

PRIOR APPLICATION NUMBER: US/05/21,233

PRIOR FILING DATE: 2000-07-21

NUMBER OF SEQ ID NOS: 2

SOFTWARE: PRESENCE of IN Windows Version 4.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           72;

Submitted (13-MAY-2003) BD Biosciences Clontech, 1020 East Meadow Circle, Palo Alto, CA 94303, USA This CDS clone is a part of a collection of human full length expression clones generated by BD Biosciences Clontech and the Harvard Institute of Proteomics. Each CDS has been cloned in two forms: with and without stop-codon (to allow fusion with C-terminal tag). The CDS has been directionally cloned using BD In-Fusion(TM) cloning system between the Sall and Hindill sites of the pDNN-DUAL vector. Additional sequences in the clone: 'ACC' after Sall site and before 'ATC' to provide Kozak consensus sequence; 'GG' after last codon and before Hindill site to maintain reading frame. Location/Qualifiers
Kalnine, N., Chen, X., Rolfs, A., Halleck, A., Hines, L., Eisenstein, S., Koundinya, M., Raphael, J., Moreira, D., Kelley, T., LaBaer, J., Lin, Y., Phelan, M. and Farmer, A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               /translation="MAAGGSTQQRRREMAAASAAAISGAGRCRLSKIGATRRPPPARV

This CDS clone is a part of a collection of human full length expression clones generated by BD Biosciences Clontech and the Harvard Institute of Proteomics. Bed, CDS has been cloned in two forms: with and without stop-codon (to allow fusion with C-terminal tag). The CDS has been directionally cloned using BD In-Fusion(TM) cloning system between the Sall and Hiddlin sites of the PDNR-DUAL vector. Additional sequences in the clone: 'ACC' after Sall site and before 'ATG' to provide Kozak consensus sequence; 'GG' after last codon and before Hiddli site to maintain reading frame.
